

Certified Capability List

This Capability List is based on a certification session performed by the TALQ Certification Tool (v2.5.1-online.3) on 2023-11-16 11:28:01.022 +0100.

The Capability List is a consolidated list of TALQ features which are implemented in a product.

The tool has succesfully performed 41 tests.

Product details		
Product Name	Luminizer Gateway	
Company	Luminext B.V.	
Туре	GATEWAY	
Notes		
Generated on	2023-11-16 11:28:01.022 +0100	
Supported profiles	Lighting	
API version certified:	2.5.1	
Certification performed by app version:	2.5.1-online.3	

Functions

Basic

The Basic function describes the properties related to the physical asset to which the logical device is associated, such as identification (assetId) and location information.

Attributes

#	Attribute	Description
~	assetId	Customer identifier of the asset. If multiple devices have the same assetId it means they belong to the same asset.
✓	swVersion	Software version installed on the device.
✓	installationDate	The installation date of Physical Device.
✓	deviceReset	The physical device containing the logical device was reset.
~	currentTime	Current time of the device defined as local time with time zone designator. [DEPRECATED: This attribute has been deprecated and it will be removed in the next MAJOR release. Please use the new TimeFunction.currentTime instead.]

Events

#	Event type	Description
~	deviceReset	The physical device containing the logical device was reset

Communication

The Communication Function contains attributes related to the communication within the ODN, and between ODN devices and Gateways. Although communication within the ODN is outside the scope of the TALQ Smart City Protocol, this Function enables access to a minimum set of configuration and state information of the ODN communication interface in order to facilitate system management from the CMS.

Attributes

# Attribute	Description
✓ physicalAddress	Physical address of the device. For example, IEEE MAC address. This attribute can be used to map between logical and physical devices. The format is specific to the ODN implementation.

✓ communicationFailure This attribute is updated by the ODN when the communication function is not operating as expected.

Events

#	Event type	Description
~	communicationFailure	This event is generated by the ODN when the communication function is not operating as expected

Gateway

The Gateway function includes the necessary attributes to enable the communication between the CMS and the Gateway according to the TALQ Specification.

Attributes

#	Attribute	Description
~	cmsUri	Base URI for TALQ communication that allows the Gateway to access the CMS. Must be an absolute URI. Other URI's for accessing CMS can be relative to this base.
~	cmsAddress	CMS UUID address
~	gatewayUri	Base URI for TALQ communication that allows the CMS to access the Gateway. Must be an absolute URI. Other URI's for accessing Gateway can be relative to this base.
~	gatewayAddress	Gateway UUID address
~	retryPeriod	Time duration before the Gateway retransmits a message for which expected response has not been received. [DEPRECATED: This attribute has been deprecated and it will be removed in the next MAJOR release. Please use the new GatewayFunction.gatewayRetryPeriod instead.]
~	crlUrn	URI where the Gateway can obtain the Certification Revocation List (CRL).
~	vendor	Vendor identification.

Lamp Actuator

The Lamp Actuator function includes attributes related to lighting control and it represents the smallest unit for control purposes. In practice, however, a Lamp Actuator function can control combinations of several lamps and control gear but all in the same way, as if they are all one individual unit.

Attributes

# Attribute	Description
 defaultLightState 	Sets the default light output for the lamp actuator. This shall be applicable if no other command is active. This attribute shall be set to 100% as default value.
 targetLightCommand 	Latest command for the lamp actuator.
 feedbackLightCommand 	This attribute reflects the command in effect and it might deviate from the actualLightState due to propagation time or due to internal ODN specific mechanisms to handle the priority of the requests.
 actualLightState 	This attribute should reflect the physical state of the light source as much as possible, including factors such as CLO. It may be calculated or measured, depending on the specific ODN implementation, which is outside the scope of this specification.
 calendarID 	TALQ Address of the calendar controlling this lamp actuator. If this attribute is empty, the behavior shall be determined by the ODN. If the attribute is invalid, the ODN shall trigger a generic invalid address event and the behavior shall be determined by the ODN.
 lightStateChange 	Light state has changed.

Events

#	Event type	Description
~	lightStateChange	Light state has changed

Lamp Monitor

The Lamp Monitor function enables monitoring of lamp parameters. A Lamp Monitor function should be associated with a specific lamp/control gear combination. Multiple lamp monitor functions may be implemented by a single device.

Attributes

# Attribute	Description
✓ lampFailure	The lamp is not operating as it is supposed to (e.g. the lamp is broken). This event shall be used to detect a situation where the lamp (or LED module(s)) should be lit, but produce no light. This could be detected by the current flowing or power consumed.

\checkmark				
	dimmingFailure		The lamp is not dimming as it is supposed to (e.g. the driver is not connected properly). This event shall be used to detect a situation where the lamp (or LED module(s)) is lighting at a dimming level which is different from the expected dimming level, taking into account the programmed (or manual) level as well any correction (e.g. virtual power, constant light output).	
		CommFai	lure Indicates failure of the control gear.	
#	vents Event type Description			
~	lampFailure	broken). Iamp (or	o is not operating as it is supposed to (e.g. the lamp is This event shall be used to detect a situation where the LED module(s)) should be lit, but produce no light. This detected by the current flowing or power consumed.

Indicates the movement is above the movementThreshold. 	

configurable by the CMS or based on internal setup of the vendor. For example, a specific location (latitude, longitude) of a device could be defined by the vendor. If the device is equipped with a

Luminext B.V.-Luminizer Gateway-2023-11-16 11:28:01.022 +0100-GATEWAY-TALQv2.5.1-online.3-CapabilityList

GPS, it could send a specific event indicating that its position is different to the one defined by the CMS. We might also want to let the configuration to the vendor itself and simply define events notifying the CMS that the default configuration has changed. For example, a garbage bin could have its location defined based on a sensor placed on the floor. If the bin is not above this sensor, the vendor will trigger an event. In this last case, the CMS does not need to configure anything.

Attributes

#	Attribute	Description
~	expectedLocation	Nominal location of the device
~	locationChangedThreshold	Distance (meters)
~	location	Location of the device
~	locationChanged	Triggered when the difference between location and expectedLocation is above locationChangedThreshold

Events

#	Event type	Description
~	locationChanged	Triggered when the difference between location and expectedLocation is above locationChangedThreshold

Luminaire Asset

This entity contains the managed and tracked attributes of a specific Luminaire, excluding the concept of Controller and Driver.

Attributes

#	Attribute	Description
~	luminaireTypeAddress	Address of the Luminaire Type
~	serial	Serial number of the Luminaire
~	projectID	Name of the Project / Tender
~	IuminousFluxConfiguration	Programmed light output of the luminaire
~	paintingColor	Painting color of the luminaire expressed as a color system-color value, (e.g: RAL-7035)
~	installationTimestamp	Installation date and time of luminaire
~	identification	Luminaire identification. (e.g: as per DiiA/D4i specification part 251 (MB1 extension)).
~	identificationNumber	Luminaire identification number. (e.g: as per DiiA/D4 specification part 251 (MB1 extension))

Installation date and time of driver

Controller Asset

installationTimestamp

This entity contains the managed and tracked attributes of a specific controller

Attributes

#	Attribute	Description
/	controllerTypeAddress	Address of the Controller Type
	serial	Serial number of the Controller
•	firmwareVersion	Version of the controller hardware firmware
/	installationTimestamp	Installation date and time of OLC
•	registrationTimestamp	Registration date and time of OLC
•	projectID	Name of the Project / Tender
/	connectionType	Type of the connection to the luminaire

Services

Configuration Service

The TALQ Configuration Service enables discovery and configuration of devices and services

Options

Description

On Demand Data Request Service

This service provides the mechanism to access attributes in the logical devices by requesting attribute values from the ODN

Group Management Service

This service provides the mechanisms to define and manage groups

Options

Option Value

Test Service

This service provides a mechanism to reduce the human intervention during the certification tests, enabling the certification tests to maximise automation

Objects

Event log data

Event log data contains a single event, with eventType and value, in each single log entry. It also includes information about whether the log denotes the start or end of the event. Furthermore additional information can be added with the info attribute.

Properties

# Property	Description
✓ eventType	Identifier of event reported
✓ srcAddress	Address of Logical device or function within a logical device which is the source of the event or to which this event applies
✓ attributes	A sequence of attribute values logged together with the event

Command

A command defines a type of control action that can be applied to a function. Commands can be generated by a manual override action or by a control program.

~	cmsRefld	CMS reference, which can be used for data logging. The cmsRefld in a Command is a free text to be used by the CMS for any purpose, e.g: to differentiate contexts. It is a token that allows the CMS to match client requests to the original notification.
